Individualised Approach to dignified End-Of-Life Care

NCG Palliative Care Guidelines – End of Life Care

NCG Palliative Care Guidelines – End of Life Care

Individualised Approach Symptom-free End-Of-Life Care

Palliative Sedation Decision making Algorithm^{1 2}

¹ Refractory symptoms: All possible treatments have failed; or there are no available methods for palliation within the time frame and the risk-benefit ratio that the patient can tolerate

NCG Palliative Care Guidelines – End of Life Care

Is Palliative Sedation appropriate for this patient?

Patient has intolerable distress due to physical symptoms; - Symptoms are refractory / intractable, despite full care that does not compromise consciousness; Death anticipated in hours- days

The treating team and Multi-disciplinary team in concurrence about intractability. They acknowledge the need and purpose for sedation - for symptom relief and not as causing hastening of death

Provide information and check for concurrence - If Yes proceed with palliative sedation for symptom-relief.

Is there ambiguity about benefit? - Use Respite sedation - here, patient awakened after a limited period and reviewed

Check with Patient: if awake & comprehends. OR, Review recorded advance care preferences. OR - check with the Healthcare Proxy

Check with Family: Informed consent after non-ambiguous discussions on pros and cons of options including option of sedation. Clarify questions. Document consent.

Ensure clear insights on the purpose - as symptom relief and not hastening death. - utilise respite sedation if they are ambiguous or unclear. Family aware and acceptis inability to communicate with the sedated patient.

All are in agreement and consented - use Palliative sedation - monitored titration of sedatives and other medications, as Continuous Subcut Infusion- aimed to relieves the patient’s refractory symptoms. Details below.

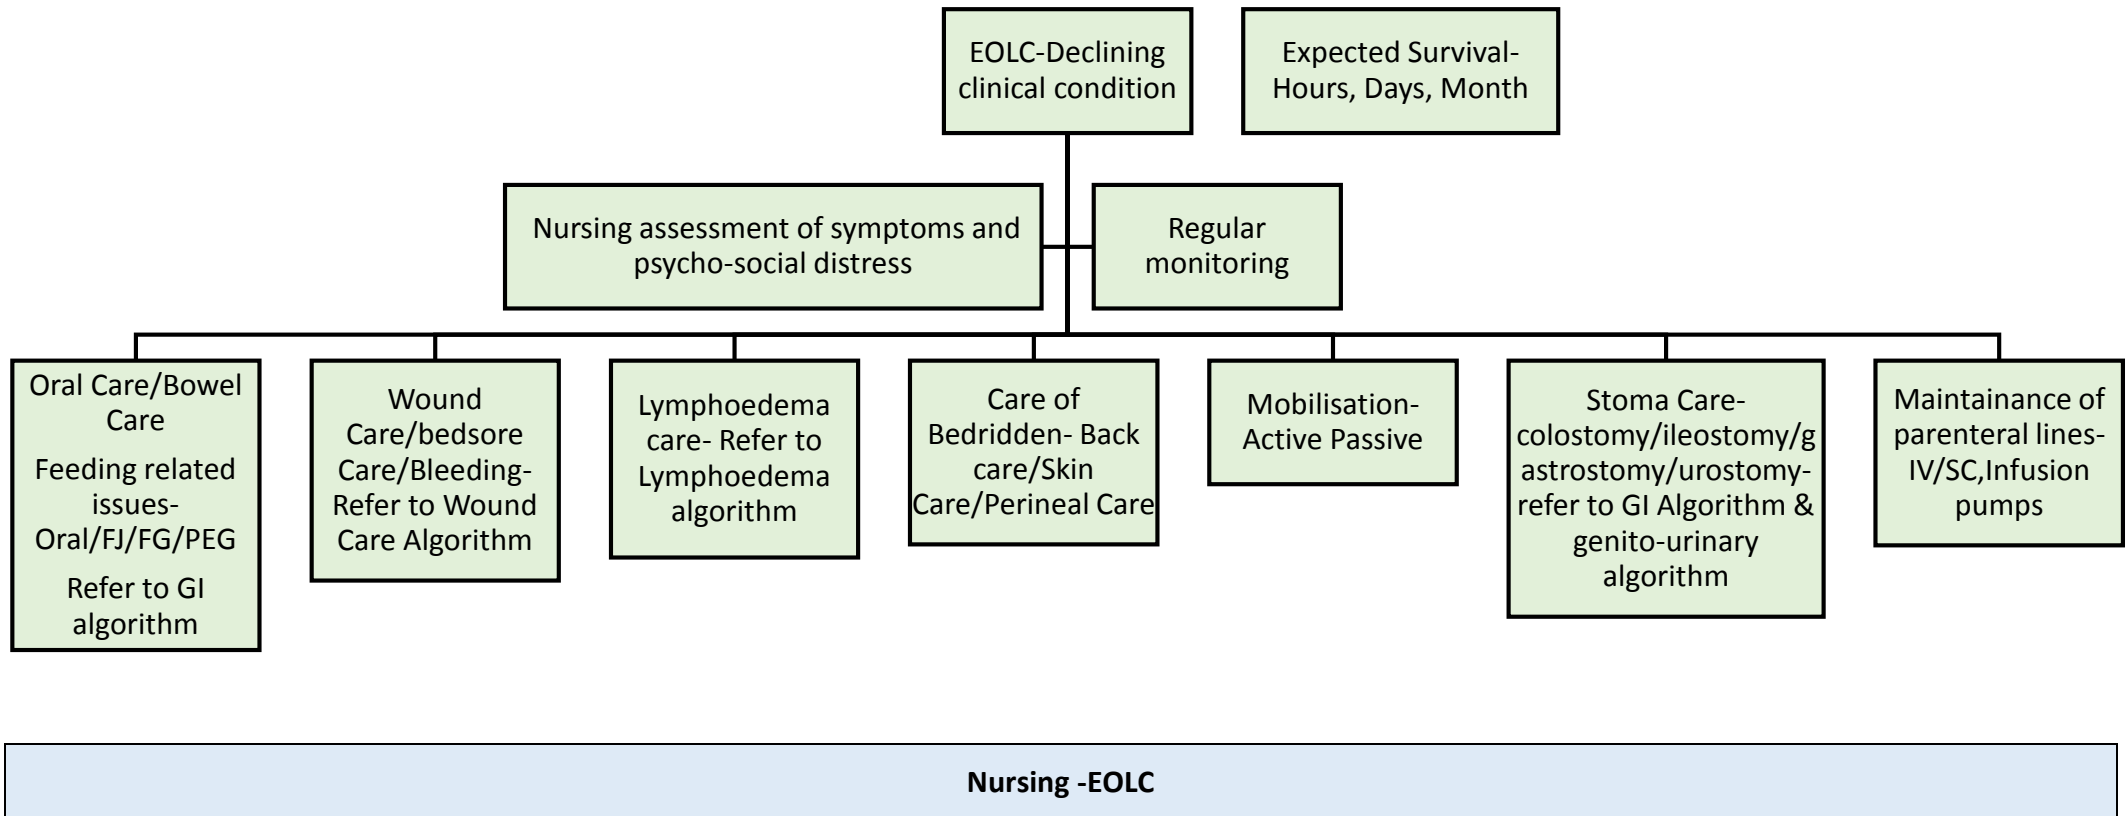

Maintain all the ongoing pain and symptom management interventions. Activate bladder/bowel care.

Provide ongoing psychosocial and spiritual support for the patient’s family and health care providers. Respect religious, cultural practices

Monitor and ensure detailed documentation

NCG Palliative Care Guidelines – End of Life Care

Approach to End-Of-Life Nursing Care:

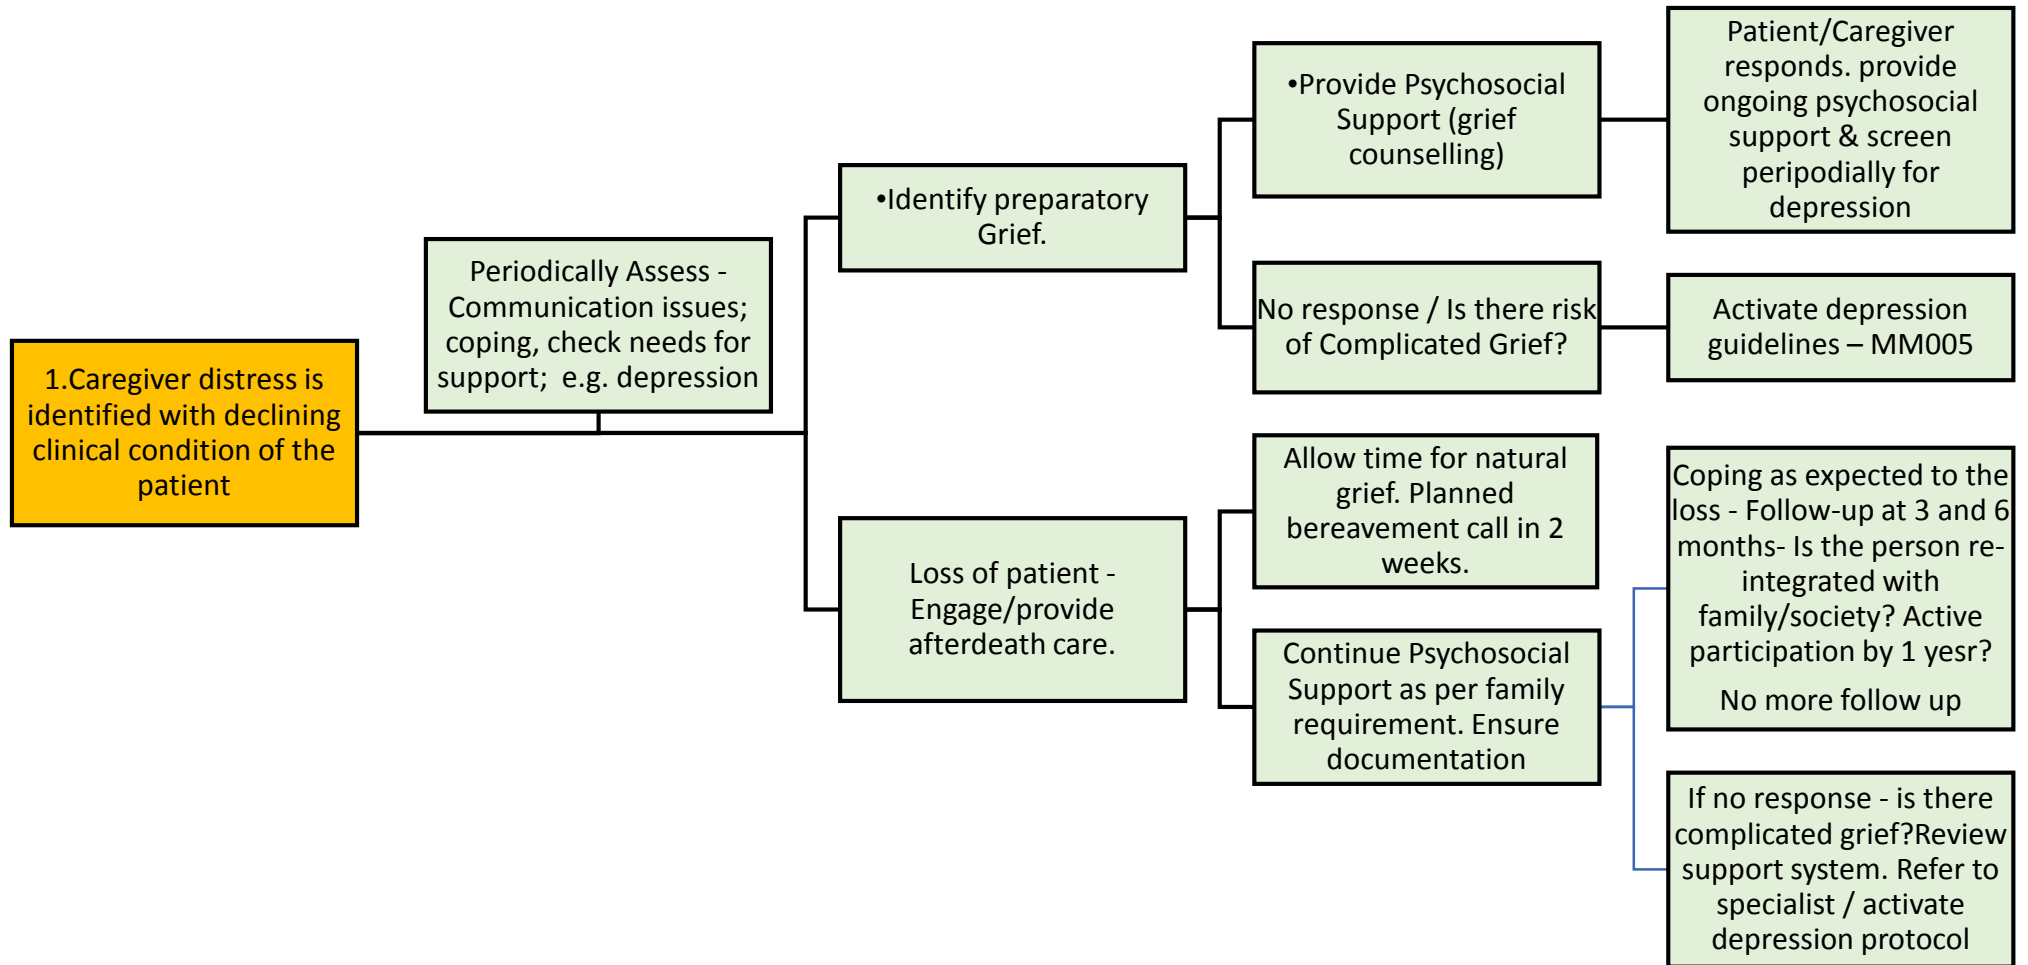

NCG Palliative Care Guidelines – End of Life Care

- Nursing assessment- physical /psycho-social/spiritual and plan procedures
 - Oral care- mucositis/oral candidiasis/xerostomia – (salt soda gargle/candid mouth paint/artificial saliva)-refer to GI algorithm
 - Bowel care- constipation-enema (high up enema) manual evacuation/ colostomy/ileostomy care- refer to GI Algorithm
 - Wound care- bedsore care/infestations(maggots)/infections refer to wound care algorithm
 - Care of bedridden- mobility(active/passive) back care/ perineal care
 - Bladder care – catheter care/bladder wash/ urostomy care
 - Lymphoedema care – maintain skin care, covered dressing on areas of leakage, positioning
- Monitor - comfort/psychological wellbeing of patient and caregiver

Approach to Grief/ Bereavement Support

NCG Palliative Care Guidelines – End of Life Care

Medicines Used Commonly During Terminal Stages³

<ul style="list-style-type: none"> Use an individualised approach. Prescribing anticipatory medicines based on symptoms expected and setting of care (e.g. home). Specify the indications for use and the dosage of any medicines prescribed. Review regularly and adjust dosages as per requirements. Assess route of drug administration - Subcutaneous /Sublingual/ PR/ IV. For ongoing symptoms - Prefer continuous sub-cutaneous Infusion (CSCI). 		
TERMINAL SEIZURE	MAJOR HAEMORRHAGE	TERMINAL BREATHLESSNESS
<p>It is usually inappropriate to investigate during the terminal stages. To prevent further seizures, commence midazolam 20-30mg/24hrs subcutaneously via syringe driver over 24hrs.</p> <p>Prescribe midazolam 5-10mg buccal or 5-10mg SC/IM as required for SOS seizure control.</p> <p>Alternatively or additionally, sodium valproate and/or levetiracetam via the subcutaneous route.</p>	<p>Bleeding occurs in 14% of patients with advanced disease. Also refer to NCG guidelines on managing bleeding in oncology patients</p> <p>It is a terminal event in approximately 6% patients. Anticipate bleeding in a pre-disposed patient (neck, inguinal, internal organs infiltrating vascular structures) with H/O sentinel bleeding; use the crisis box.</p> <p>If resuscitation is inappropriate (futile)</p> <ul style="list-style-type: none"> Maintain calm. This will reflect on the environment and influence the patient (if conscious) / care-givers. The treating team should maintain presence with the patient/family, giving support and explanation. Use dark towels to absorb blood loss – reduces visual impact of catastrophic blood-loss. 	<p>Patient not already on opioid: - Give morphine 2.5mg SC stat. Followed by 2.5mg SC 1-hrly as required Start morphine 10mg/24hrs SC by syringe driver</p> <p>Patient already on opioid :- 10 to 20 % of the baseline daily requirement of opioid, calculated in morphine equivalents, and given every 4 hours has been recommended.</p> <p>Midazolam 2.5mg SC stat; Followed by midazolam 2.5mg SC 1-hrly as required. Start midazolam 10mg/24hrs SC as infusion / syringe driver This is especially a useful option in patients with renal impairment.</p> <p>If breathlessness persists - combine opioid with midazolam</p> <p>Review within 24hrs;</p> <ul style="list-style-type: none"> if 1-2 breakthrough doses of morphine or midazolam were needed due to breathless episodes in the
<p>NAUSEA & VOMITING Haloperidol -1.5mg SC once or twice daily Hyoscine butyl-bromide 20mg SC 1-hrly doses titrated as required Octreotide as 2nd line if the symptoms do not improve within 24 hours</p>

NCG Palliative Care Guidelines – End of Life Care

<p>STOPPING NON ESSENTIAL MEDICATIONS</p> <p>All medicines that are not essential for symptom relief, but are impacting patient comfort or are likely to cause complications should be discontinued. For example – continuing hypoglycemics in a long-term diabetic, who is no longer feeding – can cause hypoglycemia and its complications. <u>Individualize the de-prescription.</u></p>	<ul style="list-style-type: none"> • Midazolam 10mg (appropriate route - IV/IM/SC/buccal/sublingual) to relieve distress in a patient that may be imminently dying. • Family needs great deal of emotional support 	<p>previous 24hrs, increase syringe driver dose by 30-50%.</p> <ul style="list-style-type: none"> • If 3 or more breakthrough doses were needed in the previous 24hrs, consider doubling syringe driver dose of drug in use and increase breakthrough dose to 5mg. • Use breakthrough doses hourly as required. • Ongoing review is mandatory. If symptoms are intractable consider palliative sedation/ seek specialist palliative care advice. <p>If Pulmonary edema suspected: Furosemide – Per Oral or I.V - Infusions have better results. If oral/ IV routes unavailable, off-label use of Sublingual / Subcutaneous / nebulization routes.</p>
<p>EXCESSIVE OROPHARYNGEAL / RESPIRATORY SECRETION</p>	<p>TERMINAL DELIRIUM</p>	<p>PALLIATIVE SEDATION</p>
<p><u>Utilise lateral positioning to let the secretions flow</u></p> <p>Drug Options:</p>	<p>Drugs: Haloperidol & if required Midazolam. Haloperidol: 1.5mg SC once or twice daily. And review within 24 hrs. If symptoms are controlled, continue SC dose either as stat OR as 12-24hrly OR via syringe driver</p>	<p>Medications may be administered orally (until the patient is sedated), sublingually, rectally, intravenously, or subcutaneously, with the route usually dependent on patient condition and clinician preference. The opioid administration is usually continued once palliative</p>

NCG Palliative Care Guidelines – End of Life Care

<p>Hyoscine butyl bromide 20mg SC 1-hrly doses titrated as required OR Glycopyrronium 200 micrograms SC 1-hrly doses titrated as required OR Specify maximum 6 doses/24hrs – frequent need should prompt review</p> <p style="text-align: center;">↓</p> <p>Regular treatment via syringe driver: Hyoscine butyl-bromide 60mg/24hrs OR Glycopyrronium 600 micrograms/24hrs</p> <p>Extra doses (SC up to 1-hrly as required, maximum 6 doses in 24hrs) Hyoscine butylbromide 20mg SC OR Glycopyrronium 200 micrograms SC</p> <p style="text-align: center;">↓</p> <p>Review after 24hours or sooner If extra doses needed, increase the 24hr dose to: Hyoscine butyl-bromide 120mg/24hrs OR Glycopyrronium 1200 micrograms/24hrs</p> <p>Monitor & manage - Dry-mouth, delirium, urinary retention, excessive sedation</p>	<p>Midazolam 2.5mg - 5mg SC stat when anxiety or agitation predominate. Initiate syringe driver: Midazolam 10-20mg/24hr SC. Breakthrough dose: Midazolam 1.5mg - 5mg SC up to 1-hrly - doses titrated as required (use lower dose in frail/elderly patients)</p> <p>Titrate / increase midazolam syringe driver dosing as estimated as equivalent to total breakthrough doses / previous 24 hours. If midazolam requirement is > 30mg/24hrs – consider adding haloperidol 1.5 – 5mg/24 hrs SC.</p> <p>Review within 24 hrs *If symptoms are controlled, continue SC either as stat doses 12-24hrly or via syringe driver *If symptoms are not controlled, increase haloperidol to 5mg/24hrs SC, and continue breakthrough doses of midazolam 5mg SC 1-hrly with doses titrated as required.</p>	<p>sedation is initiated, at doses converted for the respective route.</p> <p>Benzodiazepine <u>Midazolam</u>: Start as 0.5–5 mg bolus IV/SC, then continuous infusion at 0.5–1 mg/h; usual maintenance dose 10-20mg/24 h; titrated to effect. Max. dose 200mg/24 h. Breakthrough dose = 5-10mg. <u>Lorazepam</u>: 0.5–2 mg PO, SL, every 1–2 hours if parenteral route unavailable.</p> <p>Anti-psychotics <u>Haloperidol</u>: Start as 0.5–5 mg SC every 2–4 hours OR as continuous infusion; 5-20mg/24 h after initial dose - 1–5 mg bolus IV/SC. Breakthrough dose - 2.5 to 5mg. <u>Olanzapine</u>: 10-20mg/day S/C</p> <p>General Anesthetic agents: These are as 3rd line when drugs, including benzodiazepines, fail to produce satisfactory symptom relief.</p>
	<p>Olanzapine or chlorpromazine 25 mg IV/IM every six hours may be helpful if sedation is a desired side effect.</p>	<p>Barbiturates: when intractable pain, seizures as intractable symptoms <u>Phenobarbitone</u>: 200 mg IV/SC bolus, then CII/CSI at 600 mg/d; usual maintenance dose, 600–1,600 mg/d <u>Thiopental</u>: 5–7 mg/kg bolus IV, then CII at 20 mg/h; usual maintenance dose, 70–180 mg/h Propofol: Useful specifically as an adjuvant sedative in patients with nausea vomiting, pain or agitation as intractable symptoms.</p>

NCG Palliative Care Guidelines – End of Life Care

		<p>It is used when Midazolam, neuroleptics, and barbiturates have proved ineffective. Benefits: antiemetic, bronchodilatation, and itching control benefits.</p> <p>Dose: Infusion, gradually titrated in steps of 0.5 mg/kg/h after an initial dose of 0.3- 0.5 mg/kg administered over 3- 5 min; titrated every 15-20 minutes to the grade of sedation required.</p> <p>Max dose not > 4 mg/kg/h and the duration of infusion not > 48 hours</p> <p>Caution: hypotension, twitching, seizures. Lower dose in elderly.</p>
